# Example ITS Deployment Screen

The screenshot displays the IDAS - ITS Deployment Analysis System interface. The main window is titled "Option: incident management" and "Incident Management Systems | Combination Detection\_Response". The interface includes a menu bar (File, View, Modules, Reports, Zoom, Window, Help) and a toolbar with various icons. On the left, there are input fields for "Improvement Number" (1), "Description" (Incident Management on Freeway), "Year of Opening (yr)" (2004), and "Mid-Point of Construction (yr)" (2004). Below these is a "Select Links" button. The central area is a map showing a network of roads with several links highlighted in green and magenta. At the bottom right, a "Selected Links" list shows the following entries: 594->1303, 891->1302, 1070->1072, 1071->1850, 1072->1074, 1073->1071, 1074->1076, 1075->1073, and 1076->1065. At the bottom left, there are buttons for "Additional Benefits", "Save", "Edit Impacts", "Edit Equipment", and "Cancel".

# IDAS Performance Measure Outputs

- **Systemwide performance measures including**
  - **Mobility**
  - **Travel time**
  - **Travel time reliability**
  - **Accidents (fatality, injury, property damage)**
  - **Emissions (HC, CO, NOx, PM10)**
  - **Fuel use**
  - **Agency efficiency**
  - **Costs (capital and operating & maintenance)**
  - **Benefit/cost**
- **Viewed by**
  - **Market sector (mode)**
  - **Facility type**
  - **District (user defined)**

# Benefit/Cost Summary

**Alternative Comparison Module**

- ITS Option Comparison
  - Value of Time
    - In-Vehicle
    - Out-Vehicle
    - Travel Time-Reliability
  - Cost of Fuel
  - Non-Fuel Vehicle Operating Costs
  - Emission Costs
  - Accident Costs
    - Fatality
    - Injury
    - Property Damage Only
  - Noise Damage Costs
  - Other Mileage Based Costs
  - Other Non-Mileage Based Costs
  - Risk Analysis
    - Select Ranges
    - Run Analysis
    - View Results
  - View Outputs
    - Benefit/Cost Summary**
    - Performance Summary
      - by Market Sector
      - by Facility Type

**Benefit/Cost Summary**  
Project: Metro ITS Plan

	Weight	Baseline Transit ATS
<b>Annual Benefits</b>		
Change in User Mobility	1.00	\$ 639,596.72
Change in User Travel Time		
In-Vehicle Travel Time	1.00	\$ 1,699,338.05
Out-of-Vehicle Travel Time	1.00	\$ 854,805.11
Travel Time Reliability	1.00	\$ 3,378.01
Change in Costs Paid by Users		
Fuel Costs	1.00	\$ 86,174.39
Non-fuel Operating Costs	1.00	\$ 27,394.47
Accident Costs (Internal Only)	1.00	\$ 77,588.78
Change in External Costs		
Accident Costs (External Only)	1.00	\$ 13,691.97
Emissions		
Hydro Carbons	1.00	\$ 3,994.00
NOx	1.00	\$ 5,848.62
CO	1.00	\$ 68,506.80
PM10	1.00	\$ 0.00
CO2	0.00	\$ 0.00
Global Warming	0.00	\$ 0.00
Noise	1.00	\$ 805.72
Other Mileage-Based External Costs	1.00	\$ 0.00
Other Trip-Based External Costs	1.00	\$ 0.00
Change in Public Agencies Costs (Efficiency Induced)		\$ 68,750.00
<b>Total Annual Benefits</b>		<b>\$ 3,549,872.63</b>
<b>Annual Costs</b>		
Average Annual Private Cost		0.00
Average Annual Public Cost		525,215.97
<b>Total Annual Cost</b>		<b>\$ 525,215.97</b>
<b>Benefit/Cost Comparison</b>		
<b>Net Benefit (Annual Benefit - Annual Cost)</b>		<b>\$ 3,024,656.66</b>
<b>B/C Ratio (Annual Benefit/Annual Cost)</b>		<b>6.76</b>

Done

# IDAS Limitations (General)

- Does not directly analyze rural ITS or non-ITS type operational improvements (RWIS, HOV lanes, toll lanes)
- Initial set-up – data transfer from model can be problematic
- Requires availability of travel demand model, not directly compatible with GIS
- Travel demand model limitations
  - Static travel demand assignment
  - Constrained to time period, modes, network... of local model
  - Volumes, speeds not necessarily current
- Can not modify network within IDAS, must be done prior
- Traveler information analysis methodology too simplistic (i.e., does not capture traveler responses)
- Transit analysis capabilities limited (no transit network)
- Emissions based on Mobile 5a
- Limited graphical output, no animation
- Does not meet the needs of every analysis – too sketch versus too complex

# *Reliability in IDAS*

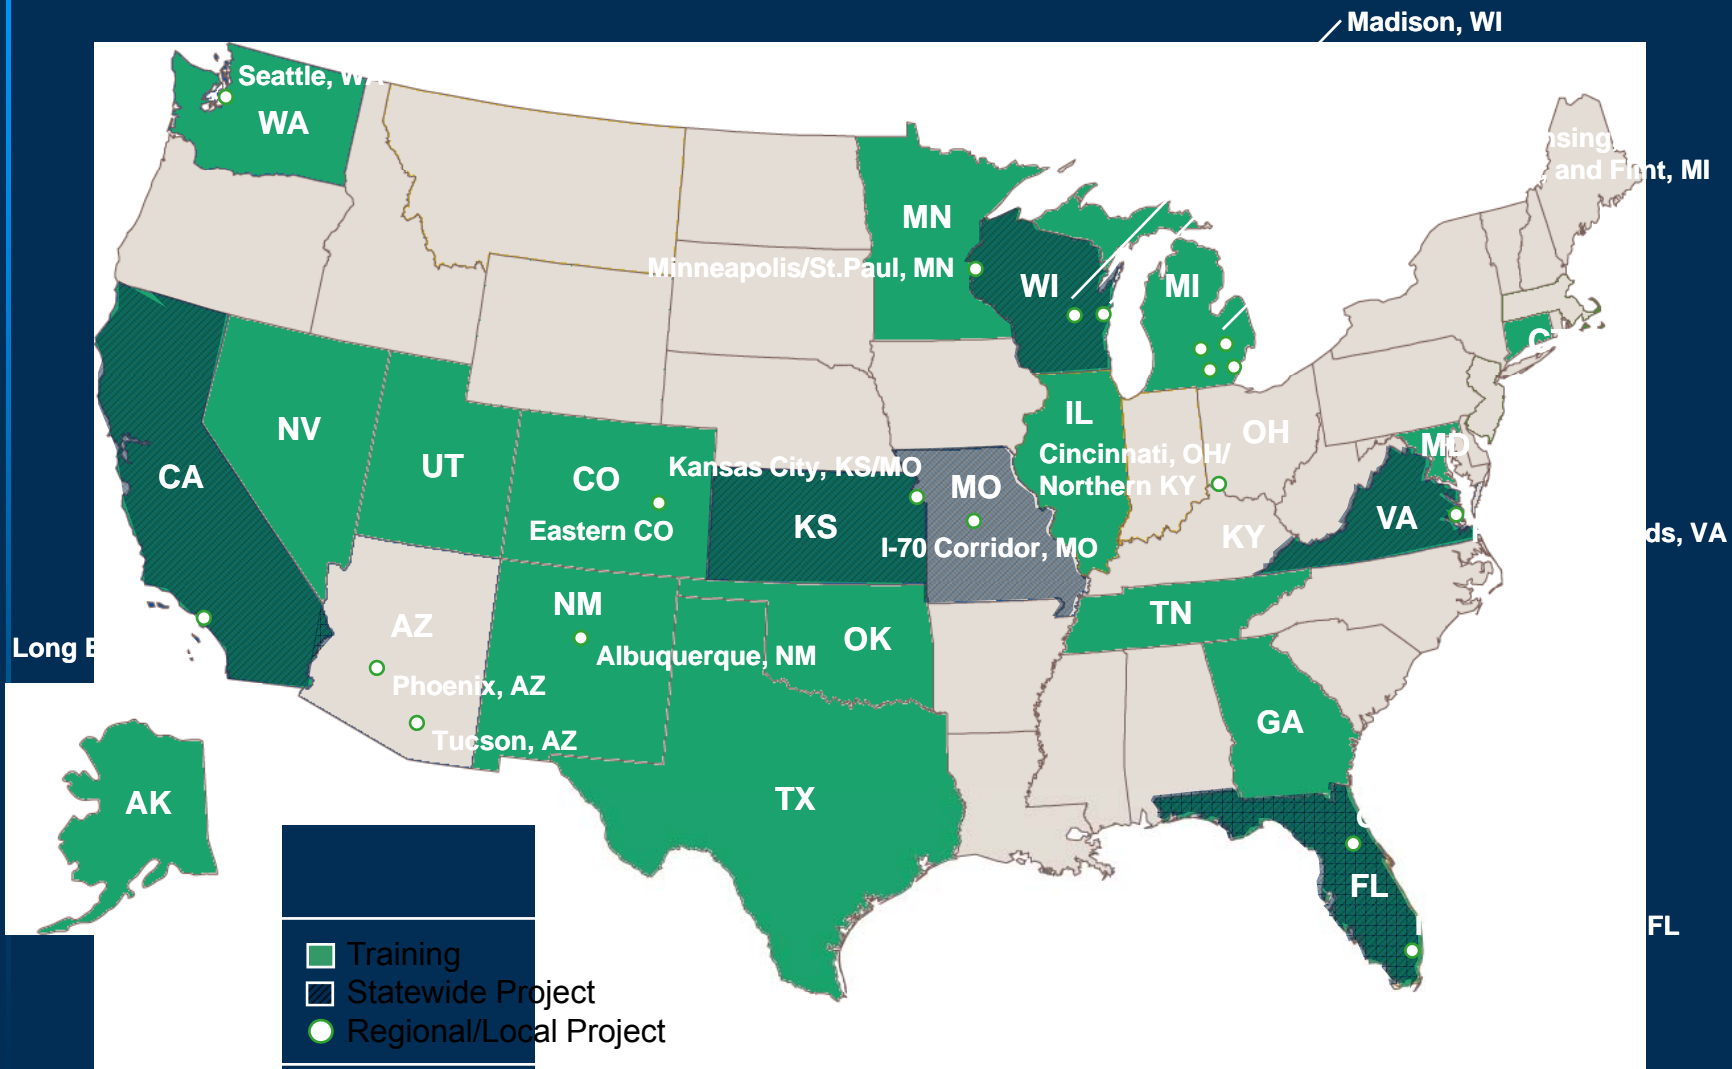

# Travel Time/Delay Estimation in IDAS

- **Recurring delay**
  - Based on modified BPR formulations (v/c ratio)
- **Incident delay**
  - Based on equations derived from stochastic modeling of incidents
    - v/c ratio
    - Number of lanes
    - Incident rate
    - Incident duration
- **Incident delay is assumed to be the reliability component**

# Travel Time/Delay Valuation in IDAS

- Review of literature (ca. 1999) revealed that the value of *unexpected* delay ranged from 1x – 6x that of average delay
  - Literature based primarily on commuters habits and preferences (stated preference)
- IDAS default value for incident delay value is 3x average delay (can be overridden)

# Where IDAS Has Been Used

# *Beyond IDAS:*

## *Some Thoughts on Improving Reliability Estimation and Valuation in Models*

# Travel Time Reliability: Definition

- Measured by how travel time varies from one time period to another
  - Can be for a link, section, trip, or network
- In other words, reliability is measured as the variability of travel times
  - “How long will my trip take today compared to the same trip at the same time on any average day?”

... this implies ...

- Travelers seek the ability to predict travel time and to arrive at destination within an “on-time window”

# Travel Time Reliability: Definition

... Which leads us to a general definition of reliability:

***A consistency or dependability in travel times,  
as measured from day to day and/or within  
different times of day***

# Travel Time Reliability: Definition

- **User perspective: How predictable/consistent is travel?**
- **Operator perspective:**
  - How does the system perform over time against a predefined standard?
  - Alternately, how susceptible is the system to breakdown or other level of service?
- **Reliability “happens” over a long period of time**
  - Need a history of travel times that capture all the things that make them variable (e.g., incidents, weather, work zones)

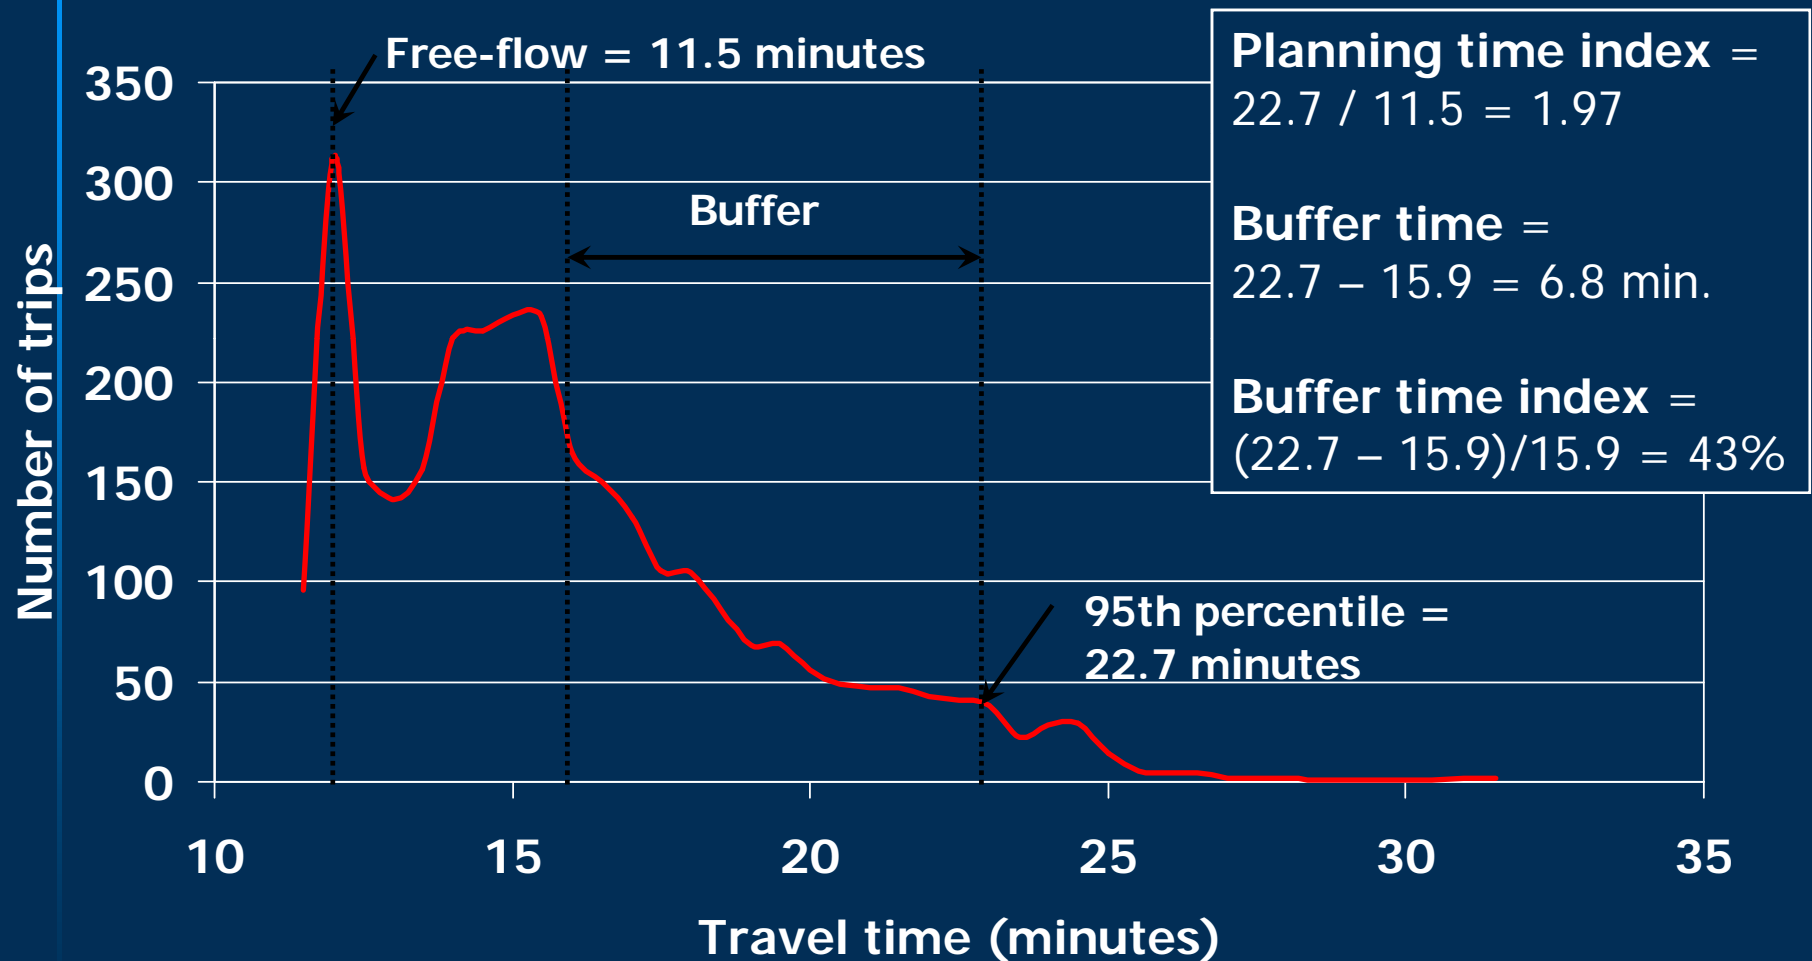

# Recurring vs. Incident Delay Is Too Simplistic

- **Even in the absence of incidents, there will be variation in travel times due to:**
  - **Weather**
  - **Volume fluctuations**
    - Normal daily/seasonal changes in demand
    - Special events
    - Emergencies
  - **Driver behavior**
    - Traffic flow at the tipping point of capacity susceptible to very small changes

# Recurring vs. Incident Delay Is Too Simplistic (cont.)

- Capacity expansion projects will also improve reliability (not just better incident management), and operations improves the average/typical condition
- SHRP 2 L03 Before/After Studies
  - FSP expansion
    - 15% reduction in unreliability
    - 20% reduction in average travel time
  - Lane addition
    - 38% reduction in unreliability
    - 35% reduction in average travel time
- Perhaps it's time for a more holistic approach

# The Complete Travel Time Distribution and the “Buffer” (Urban Freeway Section)

SR 520 Eastbound  
Seattle, 4-7pm weekdays

# Using the Concept of a Buffer in Valuing Reliability

- **Convenient way of getting at the expected vs. unexpected delay issue directly**
- **Different travelers and trip types will have different buffers**
  - **Routine commuters pad their schedules based on past experience**
  - **Travelers making infrequent trips on unfamiliar routes may not build in much of a buffer**
- **Trips made within the buffer valued at one rate (it's "planned"), but "unplanned lateness" will be valued at a premium (probably)**

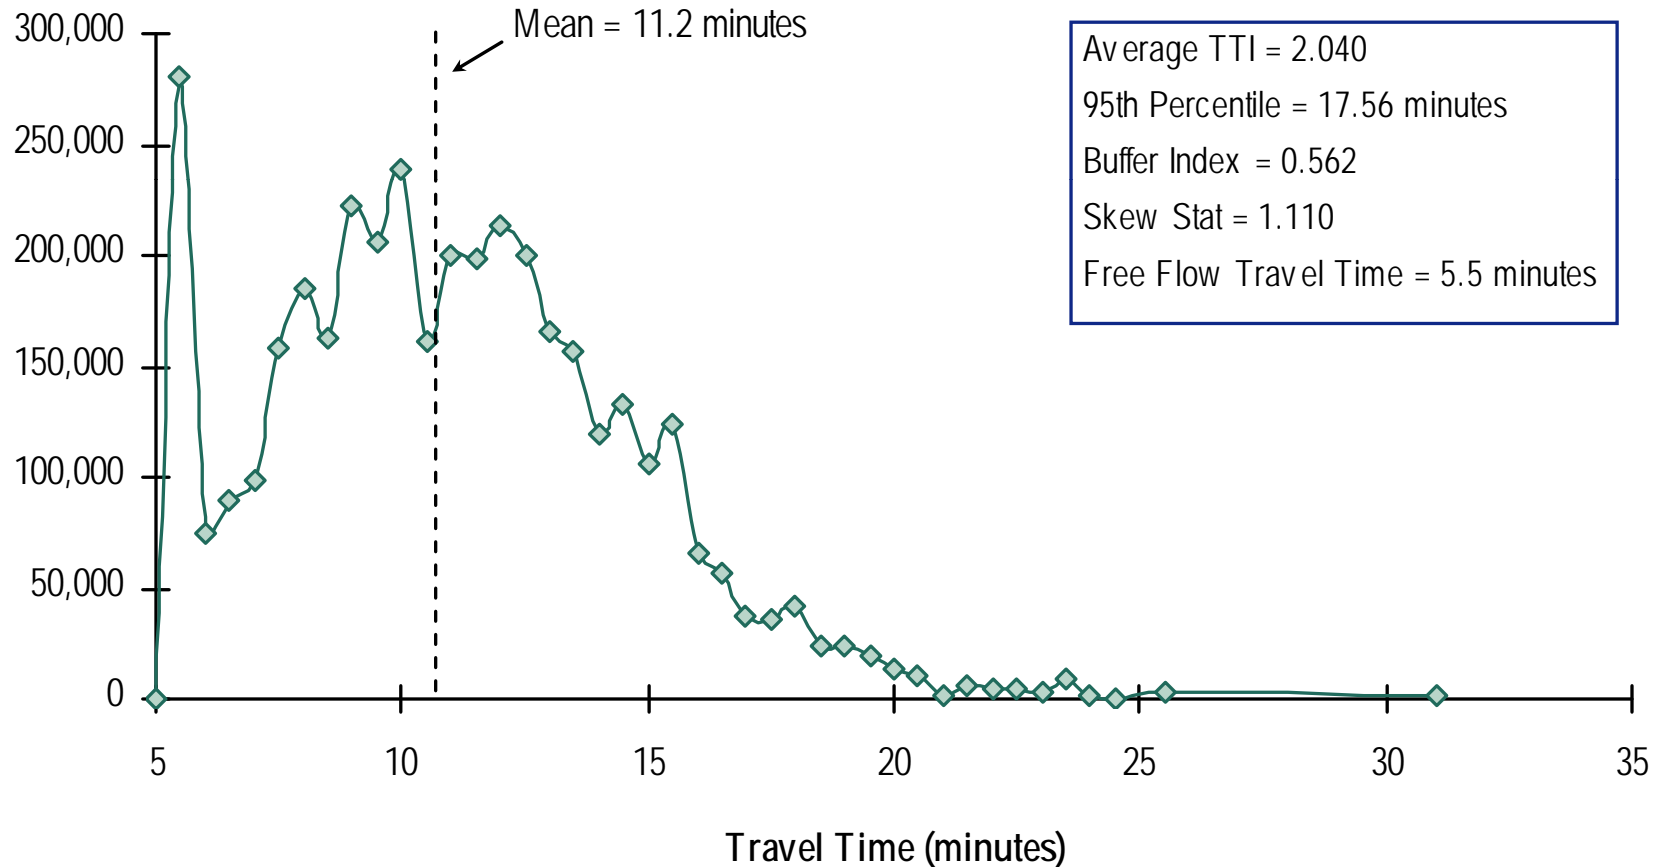

# SHRP 2 Project L03: Statistical Modeling

- Results show that all reliability measures defined in the study can be predicted as a function of average Travel Time Index
- Urban Freeways: mean, 80<sup>th</sup>, and 95<sup>th</sup> percentile Travel Time Index can be predicted as a function of:
  - “Critical” demand-to-capacity ratio
  - Lane-hours lost due to incidents + work zones
  - Hours where rainfall  $\geq 0.05$ ”
- Results applicable to extended highway sections, but these will be only a part of a complete trip
  - Can we apply valuation at the section level or do we need to value entire trips?

# Travel Time Distribution for an Urban Freeway “Section”

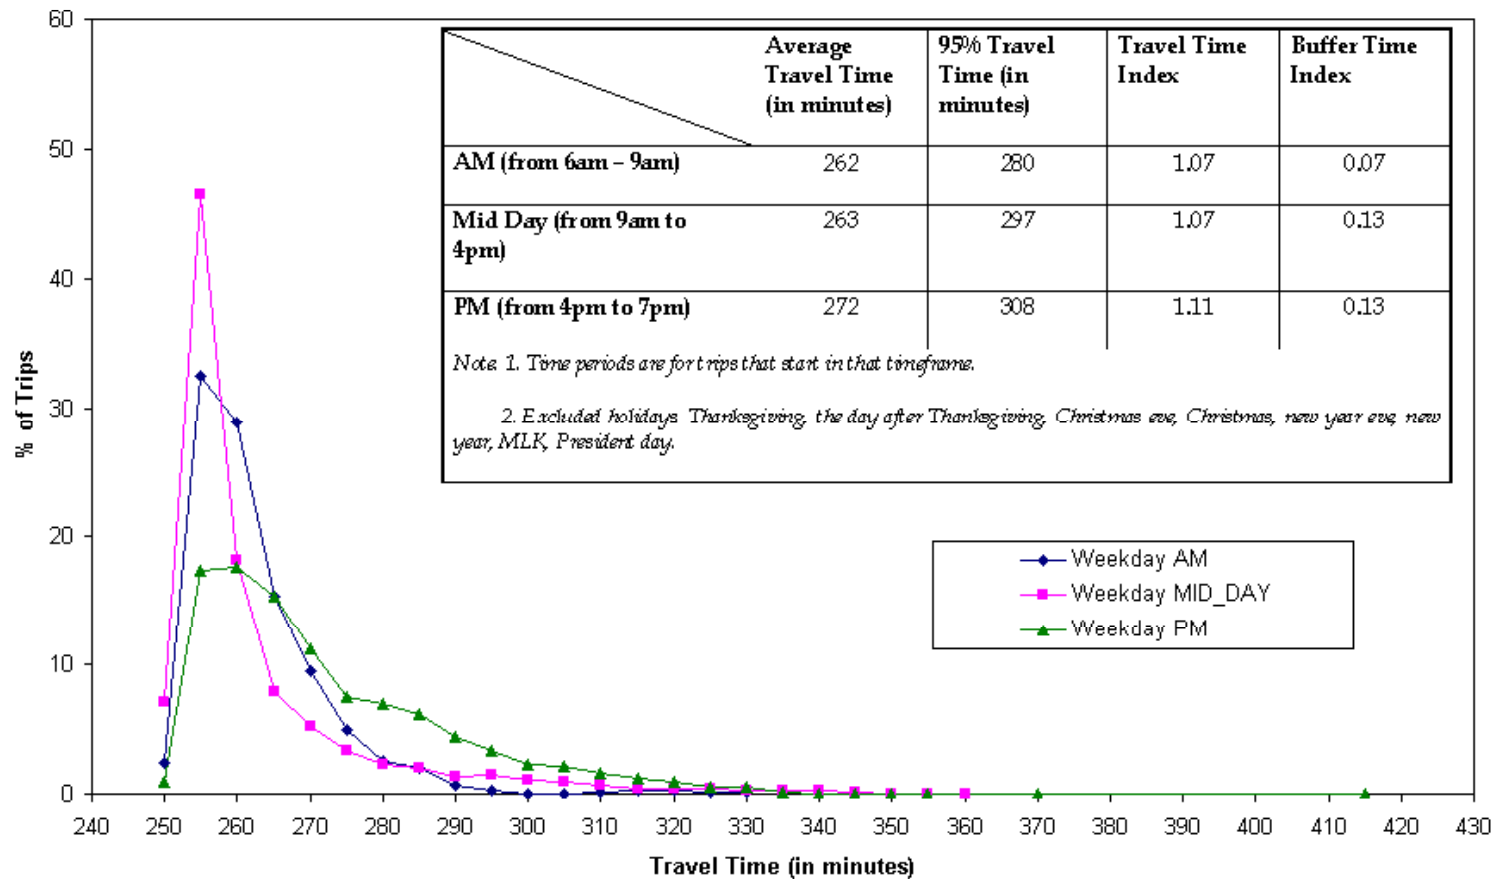

Atlanta, I-75 NB, I-285 to SR-120, 2007, Peak Period

Number of Trips

# Travel Time History for a Long Intercity Trip: D.C. to GW Bridge

Non-Holiday Weekday Travel Time Distributions  
I95 DC to GW Bridge, NB, 247 miles, Nov 2008 and March 2009

# Summary

- **Not accounting for reliability misses a substantial portion of the benefits of transportation improvements**
- **ALL types of highway improvements will improve reliability**
  - **Capacity and demand management make the system less vulnerable to disruptions by events**
  - **Operations directly targets the effects of events**
- **The concept of a “buffer” appears to be useful for segmenting the valuation of reliability**
  - **Research needed to determine how travelers actually do this**
- **Predicting the buffer (reliability) on highway sections is feasible with models**
- **But should we be concerned more with trip reliability**

Thanks!
